**ABSTRACT**

SAS/FSP is a set of procedures used to perform full-screen interactive data entry, data editing, data retrieval, and data query. This tutorial provides a basic overview of SAS/FSP software under version 6.07/6.08 of the SAS® System. Topics include:

- creating a new SAS data set
- customizing data screens
- data entry
- data query
- browsing SAS data sets and external files

The focus of this tutorial is on PROC FSEDIT although other procedures such as PROC FSBROWSE and PROC FSVIEW will be briefly discussed. Screen control language (SCL) is considered an advanced topic and will not be covered in this tutorial.

**INTRODUCTION TO SAS/FSP**

SAS/FSP contains five procedures: FSEDIT, FSBROWSE, FSLIST, FSVIEW, and FSLETTER. This workshop will concentrate on the first four procedures, with emphasis on FSEDIT. A description of the five procedures follows.

1. **FSEDIT**: Used for creating and editing SAS data sets and data views created with SAS/ACCESS as well as for data query. Data is displayed by observation.
2. **FSBROWSE**: Similar to FSEDIT without the data editing features (data set is read-only). May also be used to browse data views created with SAS/ACCESS and PROC SQL.
3. **FSVIEW**: Similar to FSEDIT but data are displayed as a table with rows and columns instead of by observation.
4. **FSLIST**: Used to view external files.
5. **FSLETTER**: Used to create letters and other reports.

**INTRODUCTION TO PROC FSEDIT**

PROC FSEDIT is one of the most powerful procedures contained in SAS/FSP software. It is an interactive procedure used to create new SAS data sets, edit existing SAS data sets, enter data, and for ad hoc queries.

**Syntax**

FSEDIT is invoked from the Program Editor Window by a PROC statement which ends with a semicolon. VAR and LABEL statements may also be used, but are optional.
This code will invoke PROC FSEDIT in data definition mode as shown in Figure 2. Note that the procedure and file name are indicated at the top of the window. Also note that the display may vary depending on the window manager being used.

![Figure 2—Data Definition Mode](image)

You create a data set by entering definition information as shown in Figure 3 below. Note the following rules for defining variables:

- Variable names must follow SAS naming conventions.
- Character variables must be assigned "type" c or $.
- Each variable should be assigned a length. Eight is the default.
- You may assign a label, format, or informit. To view the Informat column, from the Locales menu, select Format/Informat.

![Figure 3—Data Definition Mode](image)

After you are finished entering the information, from the View menu, select End to execute. A data entry screen will appear similar to the one below.

![Figure 4—Default Screen](image)

Screen Customization

You may customize your screen display to, for example, resemble a survey instrument. Modifications to the screen will be stored in the screen catalog. In our example, the catalog will be saved as DEMO1SCR.SCT01 in the library referenced by the LIBNAME statement.

To enter Screen Modification mode, from the Locales menu, select Modify screen. A dialog box will appear to allow you to assign a password. Enter a password if you wish. Click OK to close the dialog box. A screen like the one in Figure 5 will appear.

![Figure 5—Screen Modification Mode](image)

We will concentrate primarily on Options 2 (Screen Modification and Field Identification), 4 (Assign Special Attributes to Fields), and 5 (Modification of General Parameters), because that's where most of the customization features (with the exception of SCL) are to be found.

Option 2: Screen Modification and Field Identification

Select Option 2, Screen Modification and Field Identification. A screen similar to the default data entry screen will appear.

1. Turn on numbers and set tabs. To turn on line numbers, from the Edit menu, select Options. From the Options submenu, select Numbers. Type TABS6 over line number 00001 to turn tabs on. From the Edit menu, select Undo to remove the tab markers from the screen (tabs remain set).

2. Once the line numbers appear, the screen will resemble the screen below and you will have access to the SAS text editor.

![Figure 6—Numbers On](image)

You may customize the display in any way you choose. You can write over text, add lines, delete lines, move text or delete text. You can also add comments, labels, and color. Note that each field must have a space before and after it. Use underscores to create data entry fields. Figure 7 below is an example of a screen after customization.

![Figure 7—Sample Screen After Customization](image)

To exit and save your changes, from the File menu, select End. You will be asked to identify the newly moved fields to the system. When asked if you created any computational fields, respond N. These fields are created using SCL only. When prompted to identify a field, place the cursor anywhere on that field and press <CR>. When you are finished the following message will appear at the top of your screen:
NOTE: All fields are identified.

From the View menu, select End to return to the Modification Mode menu.

Option 4: Assign Special Attributes to Fields

You should now be back at the Modification Mode menu (Figure 4). Select Option 4, Assign Special Attributes to Fields. At the top center of the frame, you’ll see the identifier of the type of attribute you’re looking at. Table 1 summarizes the 13 attribute frames.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIAL</td>
<td>Sets initial values for fields.</td>
</tr>
<tr>
<td>MAXIMUM</td>
<td>Sets the maximum value allowed for fields.</td>
</tr>
<tr>
<td>MINIMUM</td>
<td>Sets the minimum value allowed for fields.</td>
</tr>
<tr>
<td>REQUIRED</td>
<td>Specifies fields that require a value.</td>
</tr>
<tr>
<td>CAPS</td>
<td>Specifies fields to be automatically capitalized.</td>
</tr>
<tr>
<td>FCOLOR</td>
<td>Specifies the color of each entry field.</td>
</tr>
<tr>
<td>ECOLOR</td>
<td>Specifies a color for flagging erroneous data.</td>
</tr>
<tr>
<td>FATTR</td>
<td>Assigns special highlighting attributes.</td>
</tr>
<tr>
<td>EATTR</td>
<td>Assigns special highlighting attributes for flagging erroneous data.</td>
</tr>
<tr>
<td>PAD</td>
<td>Assigns pad characters for blank entry fields.</td>
</tr>
<tr>
<td>PROTECT</td>
<td>Specifies protected fields (fields that cannot be edited).</td>
</tr>
<tr>
<td>JUSTIFY</td>
<td>Specifies how the values are aligned; left, or centered.</td>
</tr>
<tr>
<td>NODISPLAY</td>
<td>Specifies which fields should not be visible.</td>
</tr>
<tr>
<td>NOAUTOSKIP</td>
<td>Controls whether cursor skips to next field when you type a character in the last position of a field.</td>
</tr>
<tr>
<td>NOAUTOBLANK</td>
<td>Controls whether a field is automatically blanked out after a blank entered into a field.</td>
</tr>
</tbody>
</table>

After you have finished selecting the field attributes, from the View menu, select End to return to Screen Modification screen.

Modification of General Parameters

Select Option 5, Modification of General Parameters. Your screen will resemble Figure 8 below. Use this option to modify the screen size, color, and override options, as well as to set defaults for text searches. Changes will take effect after you exit Screen Modification mode and return to the data entry screen.

Data Entry Mode

When you enter data entry mode your customized display will appear on your screen. The file name and observation number will appear at the top of the frame.

Data Query

There are many ways to search for data within PROC FSEDIT. For example, if you know the observation number, from the View menu, select Go to observation number... and enter the number in the dialog box that appears.

In many cases you will want to query the data based on information other than observation number. You can do this based on:

- a set of conditions (Where...11 and Where also... commands from the Search dialog box).
- the value of a field (Name... and Locate... commands from the Search dialog box).
- part of the value of a field (Name... and Locate... commands).

WUSS 1993 Proceedings
Tutorials

• the value of more than one field (Find... command from the Search dialog box).

• embedded text strings\(^\text{12}\) (String... and Search... commands from the Search dialog box).

CONCLUSION

SAS/FSP is a powerful data management tool which can be used for creating new SAS data sets, data entry, and data query. It is easy to use and easy to learn. SCL can be used to enhance your application, although it is not really needed in most instances.

REFERENCES

---

1 Views created with PROC SQL are read-only and not available to FS EDIT.
2 SAS/FSP may also be accessed via SAS/ASSIST.
3 “Length” is the number of bytes of internal storage, not screen display length.
4 This is a toggle. Repeat the process to view the format column.
5 For information on the SAS Text Editor, refer to *SAS Language Reference, Version 6, First Edition*.
6 Except fields that begin in the first column or end in the last column.
7 If your machine beeps, make sure you are not in INSERT mode.
8 Not all fields must appear on the screen. To keep a variable from appearing on the screen, enter UNWANTED on the command line when asked to identify its location.
9 Version 6.08 only.
10 To view your function key assignments, click on Help, keys. If ADD is not listed, add it. Select File, end to save the changes and exit Help.
11 This is called a temporary WHERE clause. It can be canceled by clicking on Search, Where Undo.
12 Character data only.
